

Create a List Element using React CreateElement Approach

in css we write like this	background-color: "red"	snake-case
in react we write like this	backgroundColor: "yellow"	CamelCase

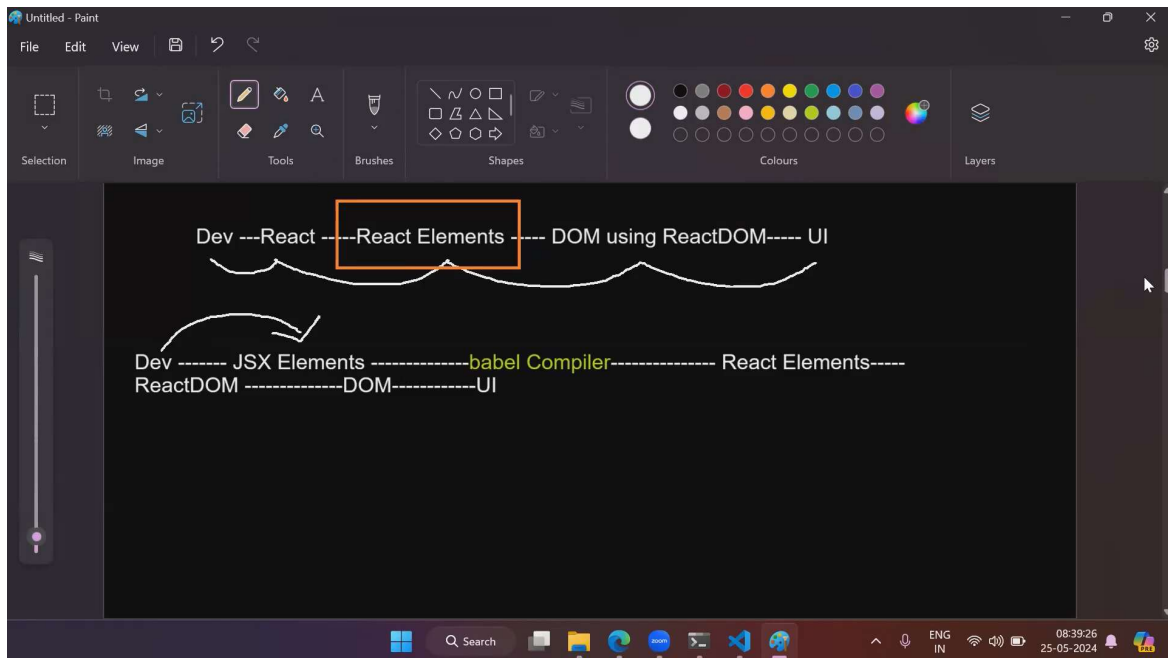

internal css and external css is same as html,
but inline css is some what different.

=====

Task-1

can you create like the above given in the React using
createElement().

as a developer

- we are creating the Elements using `React.createElement()`
- and then adding it to the Real DOM using `ReactDOM.render()`

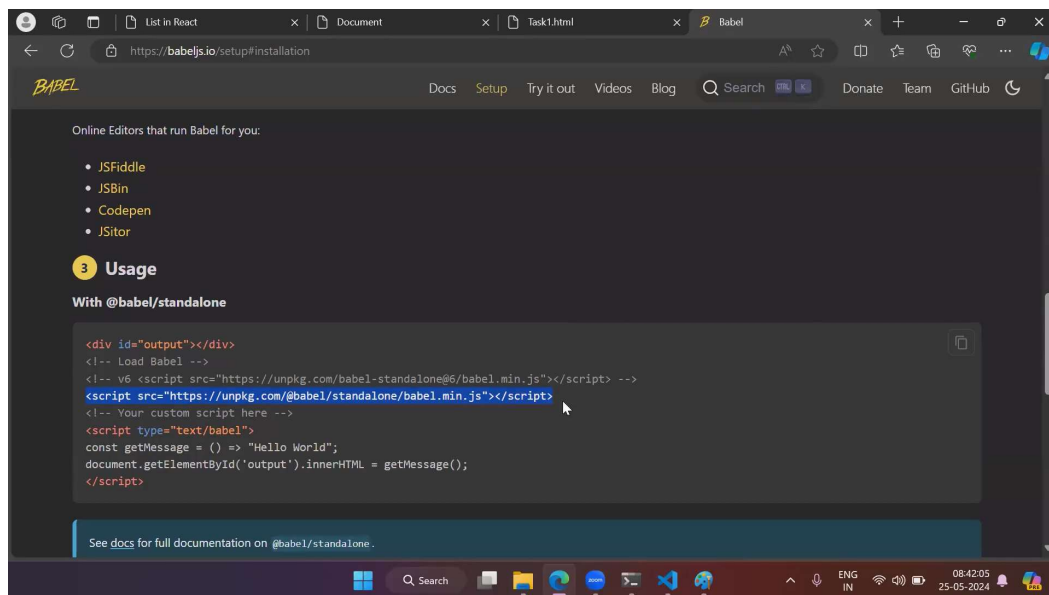

this above process is very very complex.

=====

How to create button using JSX

now we are moving to JSX Elements

- as a developer we will develop the JSX Elements
- these JSX Elements are converted into React Elements by babel compiler
- these Elements are added to DOM using the `ReactDOM.render()`
- to use the babel compiler we need Integrate babel with html file
<https://babeljs.io/setup>

- what is difference between JSX Element and HTML Elements

in next session, we will create a card and we will use the card multiple times
